Welcome from the Team at Classic Instruments!

Our congratulations and appreciation for your purchase of one of the finest quality sets of specialty instruments ever produced! Your instrument set has been conceived, designed, and manufactured by Classic Instruments, Inc. in the U.S.A. Each instrument has been tested and certified for accuracy and quality before packaging and shipping.

For trouble-free installation and operation follow the instructions exactly as outlined. Your instruments were assembled to precise specifications and although each has a seven (7) year warranty covering defective parts and workmanship – this warranty will not cover instruments or sender units which have been installed incorrectly.

Follow our recommended procedures for installation and proper hookup to maintain the value and appearance of your instrument set during many future years of accurate and dependable service!

LIMITED WARRANTY

Classic Instruments, Inc. (CI) warrants to the original purchaser that any CI product manufactured or supplied by CI will be free from defects in material and workmanship under normal use and service for a period of seven (7) years from date of purchase.

Improper installation, use of sending units other than CI’s or attempted repair or adjustments by other than CI shall void this warranty. Disassembly of any instruments or senders for whatever reason shall specifically void this warranty.

It’s always easy to look to a part for an issue with your set. Before you conclude that a part may be bad, thoroughly check your work. Today’s semiconductors and passive components have reached incredibly high reliability levels, but there is still room for error in our human construction skills. However, on rare occasions a sour part can slip through. Please be aware that testing can usually determine if the part was truly defective or damaged by assembly or usage. Don't be afraid of telling us that you “blew it”, we're all human and in most cases, replacement parts are very reasonably priced.

Purchaser requesting a product to be repaired or replaced under warranty must first call CI at 1-800-575-0461 before the return of defective part. Send defective part to 826 Moll Drive, Boyne City, MI 49712, USA. Include a written description of the failure with defective part.

Purchaser agrees and accepts that under no circumstances will a warranty replacement be furnished until CI has first received, inspected, and tested the returned part.

All other warranties expressed or implied are hereby excluded including any implied warranty of merchandise and implied warranty of fitness for a particular purpose. The sole and exclusive remedy for breach of this warranty is limited to the replacement set forth above.

It is expressly agreed that there shall be no further remedy for consequential or other type of damage, including any claim for loss of profit, engine damage or injury.

Remove the Original Instrument Cluster from the Dash

1) Remove the dash pad.
2) Remove the four screws fastening the lower steering column trim piece with a Phillips screwdriver.
3) Remove the two nuts that hold the steering column in place.
4) Lower the steering column. Take note if any shims are on the column mount.
   a. NOTE: If the car is column shift the shift indicator cable will need to be removed from the right
      hand side of the column. Care must be taken not to break it.
5) Remove the four heater control panel screws and move the heater control panel out of the way.
6) Remove any speaker brackets that prevent the dash from being removed.
7) Remove the seven bolts/screws that hold the dash panel assembly in the car with a 7/16”
   wrench/socket/swivel-socket. Save the bolts/screws and take note of their locations.
   
   ![Fastener Locations]

8) Pull the dash panel forward and remove the speedometer cable from the speedometer assembly.
9) Carefully disconnect any wire connections from the dash panel and components mounted in the dash
   panel or that are preventing the dash panel from being removed. See the below list as a guideline for
   connections to be removed:
   a. Cigarette lighter
   b. Blower motor
   c. Stereo
   d. Dash lights
   e. Glove box light
   f. Radio antenna
   g. Headlight switch
10) Remove the dash panel from the vehicle.
11) Remove the headlight switch.
12) Remove the original dash carrier with the seven mounting screws.

13) Remove the instrument panel lens. Take care not to scratch the lens if you are reusing it.

14) Remove the speedometer cable from the vehicle.
Installing your Classic Instruments gauge package

1) Clean your original lens with a soft rag and cleaner if it is being reused.
2) Pull the supplied rubber bumper through the front side of the clock reset hole in the lens to seal the lens. Cut the excess length off the backside of the bumper. If the original lens is being reused and the hole already has a plastic plug, the included rubber bumper is not needed.

![Rubber bumper]

3) Carefully use compressed air to blow any dust off the gauge faces or out of the gauge carrier.
4) Place the lens on the dash carrier lining up the locating pins. Make sure the lens is completely seated on the carrier.

![Dashboard with gauge faces]

5) Place the headlight switch lens on the dash carrier using the three locating pins and slot.

![Headlight switch lens on dashboard]
6) Install the gauge package into the dash with the supplied screws.

7) Reinstall the headlight switch.
8) Reinstall the dash panel into the vehicle.
9) Reconnect any wire connections that were disconnected to remove the dash from the vehicle.
10) Reinstall the speaker mounts and speakers.
11) Reinstall the heater control panel.
12) Reinstall the steering column with the original shims (if required) and two mounting nuts.
13) Reinstall the lower steering column trim piece with the Phillips-head screws.
14) Use the wiring diagram and information below to make the necessary wiring connections. Secure the wiring harness under the dash.
15) Classic Instruments recommends using the SkyDrive GPS speedometer sending unit (SN81) or Speedometer Signal Interface (SN74Z) to make the speedometer calibration easier. These parts will eliminate the need for the dip switches on the back of the speedometer housing which are difficult to access once the dash panel/instrument cluster are installed. If you choose to use the dip switch method of calibration the dash panel may need to be removed to access the back of the speedometer.
16) Reinstall the dash pad.
Wiring Your New Instrument Cluster

**Speedometer Wiring with SN16 Signal**

1) Always disconnect the positive lead from the vehicle battery before wiring any gauge.
2) Connect the **Black / White** wire of the speedometer wire harness to the **black** wire of the SN16 pulse signal generator.
3) Connect the **Purple** wire of the speedometer wire harness to the **white** wire of the SN16 pulse signal generator.
4) Connect the **Red / White** wire of the speedometer wire harness to the **red** wire of the SN16 pulse signal generator.
5) Connect the **Black** wire of the speedometer wire harness to a good chassis ground.
6) Connect the **Pink** wire of the speedometer wire harness to a switched +12VDC power source.

![Speedometer Wiring Diagram]

**SN16 Signal Calibration**

1) Turn off power to the speedometer.
2) Set the 12 dip switches on the back of the speedometer to their default position (**5, 6, 7, 8 OPEN, all others CLOSED**).
3) Check the current speedometer calibration at a known 60mph by pacing a vehicle with a calibrated speedometer or by using a GPS.
4) Note what the speedometer is indicating at a known 60mph.
5) Look up what the speedometer was indicating on the 16,000 PPM calibration chart and set the speedometer dip switches according to the chart. The dip switches shown on the chart should be the ONLY switches set to OPEN. All other dip switches should be set to CLOSED.
6) The speedometer should now be accurate. The dip switches must be set back to the default setting in order to use the calibration chart on future calibrations.

Default speedometer dip switch setting (**5, 6, 7 and 8 OPEN**):
Set speedometer switches 5 6 7 8 OPEN, all others closed (code for 16,000 PPM). Drive vehicle at 60mph. If the speedometer reads other than 60, turn off power & set switches per chart below.

</table>
Speedometer Wiring with SN74Z Signal Interface

1) Connect the red / white wire of the speedometer harness to the SN74Z terminal marked +12 VOLTS.
2) Connect the black / white wire of the speedometer harness to the SN74Z terminal marked GROUND.
3) Connect the red wire of a Classic Instruments SN16 pulse signal generator to the SN74Z terminal marked SENDER +. *If you are not using a pulse signal generator, this terminal is not used.*
4) Connect 1) one wire of an electronic transmission’s vehicle speed sensor (VSS), 2) one wire of a 2-wire pulse signal generator or 3) the black wire of a Classic Instruments SN16 pulse signal generator to the SN74Z terminal marked SENDER -.
5) Connect 1) one wire of an electronic transmission’s vehicle speed sensor (VSS), 2) one wire of a 2-wire pulse signal generator, 3) the white wire of a Classic Instruments SN16 pulse signal generator or 4) a Computer (ECM / PCM) generated speed signal to the SN74Z terminal marked SPEEDO IN.
6) Connect the purple wire of the speedometer harness to the SN74Z terminal marked OUTPUT.
7) Optional: The SN74Z terminal marked CRUISE puts out an 8,000 pulse per mile 12-volt square wave signal that can be used as a signal source for a cruise control, lockup converter, etc…
8) Connect two wires from a momentary contact pushbutton to the two terminals on the SN74Z marked BUTTON. *A pushbutton is also mounted to the SN74Z that can be used in place of a remote button attached to the BUTTON terminals.*

Wiring Diagrams on Following Page
Figure 1: Vehicle Speed Sensor (VSS) Connection

Figure 2: 2-wire Pulse Signal Generator Connection

Figure 3: SN16 Pulse Signal Generator Connection

Figure 4: ECM/PCM Speed Signal Connection

SN74Z Dip Switch Settings

- **Dip Switch #1:**
  - Set switch #1 ON to set the output to 8,000 pulses per mile (ppm). *(Classic Instruments speedometers that have 8 dip switches on the back require 8,000 ppm)*
  - Set switch #1 OFF to set the output to 16,000 pulses per mile (ppm). *(Classic Instruments speedometers that have 12 dip switches on the back require 16,000ppm)*

- **Filter Switch:**
  - Set the Filter Switch ON for square wave speed signals such as ECM / PCM speed signals or SN16 / SN16F pulse signal generator signals.
  - Set the Filter Switch OFF for sine wave speed signals such as OEM vehicle speed sensor (VSS) signals or SN96 / SN95 pulse signal generator signals. *(sine wave signal sensors always have 2 wires)*

- **Dip Switches #2 - #5** are NOT used
**Speedometer Dip Switch Settings**

Classic Instruments speedometers have a row of rocker switches on the back that are used to calibrate the speedometer in certain applications. However, if you are using a SN74Z, the speedometer rocker switches are not used to calibrate the speedometer.

- **Switches 5, 6, 7, 8 OPEN** *(pushed in away from the number side of the switch)*. All other switches *(1, 2, 3, 4 & 9, 10, 11, 12) CLOSED* *(pushed in toward the number side of the switch)*.

**SN74Z Speedometer Calibration Modes**

There are three calibration modes you can use to calibrate the SN74Z. Use whichever mode seems easiest for your application. It is not necessary to perform all calibration modes.

**Instant Calibration Mode**

- Start with vehicle power off.
- Press and **hold** the calibration button and start the engine. **Once the engine is running, release the button.**
- The LED digit will display **C**, indicating entry into module select mode.
- After a few seconds, the LED digit will display **S**, **r** or **F**. Tap the button to cycle round robin through these setup options. Press and **hold** the button when the LED digit displays **S** *(indicating setup for speedometer applications)*.
- Release the button when the LED digit displays **C**, indicating entry into calibration mode.
- Tap the button to change the LED digit to **1** indicating instant calibration mode. **Continuing to tap the button will cycle round robin through the calibration modes 1, 2, 3 and F.**
- Press and **hold** the button with the LED digit indicating **1** until the **1** starts blinking.
- Begin driving at 30 mph based on GPS or a pace car. *(The green LED on the SN74Z should blink indicating that it is getting a signal)*.
- While driving steady at that speed, press and **hold** the button until the LED digit changes back to **C** *(to confirm that calibration is saved)*.
- The speedometer should now begin reading 30 mph.
- Press and **hold** the button while the LED digit displays **C** to exit calibration mode. *(Tap the button to cycle round robin through the calibration modes again if you would like to perform another calibration).*
Real-Time Calibration Mode

- Start with vehicle power off.
- Press and hold the calibration button and start the engine. *Once the engine is running, release the button.*
- The LED digit will display C, indicating entry into module select mode.
- After a few seconds, the LED digit will display S, r or F. Tap the button to cycle round robin through these setup options. Press and hold the button when the LED digit displays S (indicating setup for speedometer applications).
- Release the button when the LED digit displays C, indicating entry into calibration mode.
- Tap the button to change the LED digit to 2 indicating real-time calibration mode. *Continuing to tap the button will cycle round robin through the calibration modes 1, 2, 3 and F.*
- Press and hold the button with the LED digit indicating 2 until the 2 starts blinking.
- Begin driving a known speed. *(The green LED on the SN74Z should blink, indicating that it is getting a signal).*
- Press and hold the button to change the speed shown on the speedometer. The first time the button is pressed and held, the speed shown on the speedometer will increase. The second time the button is pressed and held, the speed shown on the speedometer will decrease.
  - The SN74Z will alternate increasing or decreasing the speed shown on the speedometer each time the button is pressed. Press and hold the button to fine tune the speed shown on the speedometer.
- Once the speedometer is reading the correct speed, wait 8 seconds without pushing the button *(in order to save the calibration).* The LED digit will change back to C to confirm calibration is saved.
- Press and hold the button while the LED digit displays C to exit calibration mode. *(Tap the button to cycle round robin through the calibration modes again if you would like to perform another calibration).*
Marked Mile Calibration Mode

- Start with vehicle power off.
- Press and hold the calibration button and start the engine. *Once the engine is running, release the button.*
- The LED digit will display C, indicating entry into module select mode.
- After a few seconds, the LED digit will display S, r or F. Tap the button to cycle round robin through these setup options. Press and hold the button when the LED digit displays S (indicating setup for speedometer applications).
- Release the button when the LED digit displays C, indicating entry into calibration mode.
- Tap the button to change the LED digit to 3 indicating marked mile calibration mode. *Continuing to tap the button will cycle round robin through the calibration modes 1, 2, 3 and F.*
- Press and hold the button with the LED digit indicating 3 until the 3 starts blinking.
- Begin driving a known mile. *(The green LED on the SN74Z should blink, indicating that it is getting a signal).*  
  o When driving the known mile, the speedometer will not indicate any speed. This is normal.
- At the end of the known mile, press and hold the button until the LED digit changes back to C to confirm calibration is saved.
- Press and hold the button while the LED digit displays C to exit calibration mode. *(Tap the button to cycle round robin through the calibration modes again if you would like to perform another calibration).*
Tachometer / Quad Gauge Wiring

1) Always disconnect the positive lead from the vehicle battery before wiring any gauge.
2) Connect the Pink wire of the wire harness to a +12VDC switched power source.
3) Connect the Black wire of the wire harness to a good chassis ground.
4) Connect the Dark Green wire of the wire harness to the supplied Classic Instruments temperature sender.
5) Connect the White wire of the wire harness to the tachometer signal.
   a. STANDARD POINTS & CONDENSER SYSTEM
      i. Connect to the negative side of the coil (usually marked as “-“).
   b. GMC – HEI (High Energy Ignition System)
      i. Connect to the “TACH” terminal on coil side of distributor cap.
   c. MSD (Multiple Spark Discharge System)
      i. Connect to the TACH signal from the MSD box.
   d. VERTEX MAGNETO SYSTEM
      i. Connect to the “KILL” terminal on the side of a Vertex magneto body. An external adapter such as an MSD “Pro Mag Tach Converter” #8132 may be required.
   e. ACCEL IGNITION COILS
      i. Connect to the negative side of the coil. CAUTION! Some Accel ignition coils require the tach signal wire to be connected to the “+” terminal on the coil! PLEASE carefully read Accel’s instructions before connecting ignition coil.
   f. MALLORY IGNITION
      i. Connect to the negative terminal side of coil (usually marked as “-“).
   g. ECM TACHOMETER SIGNAL
      i. Connect to the signal from the computer. The tachometer typically needs to be set on 4 cylinder setting.
   h. MULTIPLE COIL IGNITION SYSTEMS
      i. A tach adapter may be required for these ignition systems. A tach signal driver such as the MSD #8913, which produces a 12V square wave signal, is recommended. Please check with manufacturer for your specific application.
      i. NOTICE! For all other ignition systems please look at the owner’s manual for that system.

6) Connect the Tan wire of the wire harness to the stock [0-90 ohm] fuel sender.
7) Connect the Dark Blue wire of the wire harness to the supplied Classic Instruments oil pressure sender.
8) Connect the Blue / White wire of the wire harness to the right turn indicator power wire of the vehicle’s turn signal switch.
9) Connect the Light Blue wire of the wire harness to the left turn indicator power wire of the vehicle’s turn signal switch.
10) Connect the Light Green wire of the wire harness to the high beam indicator power wire of the vehicle’s light switch.
11) Connect the Grey wire of the wire harness to the dash light power wire from the vehicle’s light switch.
Oil Pressure Sender Installation

(Part No. SN52, SN53 & SN54)

1) Disconnect battery before installation.
2) Only install Classic Instruments sending units when the engine is COLD.
3) DO NOT use Teflon tape on the threads. These threads are slightly tapered and designed to be self-sealing. The sender uses the threads for its ground connection and sealant may cause a poor ground causing inaccurate readings.

**GM Installation:** The correct location on most GM V8-engines to install the oil pressure sender is under the distributor housing at the rear of the block.

Use the 2 piece bushing kit provided to allow the sender to be mounted at a 45-degree angle pointing towards the driver’s knees. This allows the sender to clear the back of the intake manifold, the underside of the distributor housing and also the firewall.

**GM Installation – Big Block Engines:** We do NOT recommend installing Classic Instruments’ oil pressure sender in the opening located just above the oil filter on some big block GM engines. This location may not be a full-pressure passage but instead a “by-pass” oil passageway. Installing our pressure sender at this location may result in some strange low-pressure readings under certain driving conditions. This does not indicate a defective instrument or sender! It simply means you need to move the sender to the correct location.

**GM Installation – LS Engines:** Install the sender in the oil bypass housing located just above the oil filter. The housing will need to be drilled and tapped to 1/8”NPT.
Temperature Sender Installation
(Part No. SN12MM, SN22, SN23, SN24 & SN25)

1) Disconnect battery before making any connections.
2) Install the Classic Instrument’s temperature sending unit only when the engine is COLD!
3) DO NOT use Teflon tape on the threads. These threads are slightly tapered and designed to be self-sealing. The sender uses the threads for its ground connection and sealant may cause a poor ground causing inaccurate readings.
4) Install the temperature sender into the intake manifold of your engine as possible. Installing the sender in the engine cylinder head may cause inaccurate temperature readings.  
   a. On GM “LS” engines, the temperature sender mounts on the passenger side of the engine under the rear cylinder. A 12mm thread sender is available to fit this location.
5) Connect a wire from the top terminal of the temperature sender to the Dark Green wire of the gauge harness.
6) Tighten until snug. DO NOT OVER TIGHTEN!

Notice: Avoid installing the temperature sender into the head of a late-model GMC engine. Even though the stock GMC sender may have been installed there, this opening is too close to the exhaust header and will most likely cause an improper reading.
